The main user interface elements of AutoCAD are: the drawing board, the drawing area, the command bar, the toolbar, the screen palette, the dialog boxes and the status line. The drawing board is the area where drawings are created. The drawing area is the area where drawings are displayed. The command bar is the window where the standard and user-defined commands are displayed. The toolbar is the area in which tools are displayed and the user can click and drag tools to the current drawing area for use. The screen palette is the area where color and other properties of objects are configured and the dialog boxes and status line display information to the user. The user interface of AutoCAD 2014. The User Interface The User Interface of AutoCAD has been a source of study and development. According to the Autodesk, the User Interface (UI) of AutoCAD has been the source of study and development. According to Autodesk, the AutoCAD user interface has always followed two principles: to provide a creative, intuitive, easy-to-learn and easy-to-use software package. the software package, the software package. to provide a standardized and consistent user experience across all platforms. The basic building blocks of the AutoCAD user interface include the drawing board, the drawing area, the command bar, the toolbar, the screen palette, the dialog boxes and the status line. Each of these elements is well-documented in the User Interface Guide, which can be found here User Interface Table of Contents [User Interface Table of Contents] The Drawing Board: Create, Edit and Display Documents The Drawing Board is the area where a user begins drawing. It contains several layers, including the layer that serves as the default layer to which all other layers are drawn upon. The layer can be changed at any time by clicking on it or by using the Layer commands. The layers can be grouped by using the Layer Group command. The layers are organized by layer type, such as architectural, drafting, mechanical, etc. The Drawing Board can be manipulated by moving, resizing, rotating and flipping. To move the Drawing Board, the left and right arrow keys are used. To resize the Drawing Board, the up and down arrow keys are used. To rotate the Drawing Board, the left and right arrow keys are used. To flip the Drawing Board, the Control key and the Spacebar key are used

Storing a drawing as a file In version 2010 AutoCAD stores all user-changes in the drawing file, not just changes from the last save (as in AutoCAD LT) but also changes that occurred after the drawing was created (as in AutoCAD). In AutoCAD versions before 2010, the drawing was saved as a template file for the current drawing only. The drawing template would save, with each new drawing, all of the user changes made since the last saved drawing. Filetypes AutoCAD files are in three different file formats, depending on the version of AutoCAD being used: AutoCAD 2008 and earlier: PostScript files, EPS files, RTFM files, plus the drawing template and assembly package files (created with AutoCAD 2008 and later) AutoCAD 2010: DXF, DWG, and other file formats AutoCAD 2014: DXF, DWG, DWF, DWF/DXF, UMX (replaces RTFM), and DXF/DWG (replaces EPS) file formats, plus the drawing template and assembly package files Starting with AutoCAD 2016, there is only DWG, DWF, DWF/DXF, DXF/DWG, UMX, and DXF/DWG (replaces EPS) file formats. The other file types such as the.rtfm (replaces RTFM) file format is no longer supported and the.eps file type was deprecated in AutoCAD 2015. Newer file formats offer better capability in design, especially in networked environments. DWF/DXF is based on the ISO standard DWG. Many old.rtfm files can be imported into AutoCAD using the rtfm utility, which is included with AutoCAD. There is also a new file format which is more current: UMX, which offers a superset of the capabilities of AutoCAD. It is known as UMG (Unified Modeling Language) in earlier versions of AutoCAD, but renamed in version 2015. Both are capable of "bitmap-based" rendering, and in the newer format the stored data is represented with blocks. DRC Dynamic Rasterization Capability (DRC) is the ability to render surfaces by rasterizing graphic objects to create a discrete surface and then rendering that surface with the screen's hardware capabilities. It enables separate, independent bit a1d647c40b
