Transfemoral or transapical aortic valve implantation in young patients with severe aortic stenosis: the RIDE-AVR study. Transapical and transapical transcatheter aortic valve implantation (TA-AVI and TA-TAVI, respectively) have the potential for better outcomes compared with conventional transfemoral aortic valve implantation (TF-AVI) in elderly patients. However, it is unclear if TA-AVI and TA-TAVI are better suited for younger patients who have been shown to have higher risk of complications after TF-AVI compared with TA-AVI. We compared the early safety and effectiveness of TF-AVI, TA-AVI, and TA-TAVI in patients aged
