Camellia sinensis-derived lactonamide herbicide, fesalide, is a potent inhibitor of peptidate biosynthesis in soybean cell cultures. Camellia sinensis (L.) OKAIENS), a widespread perennial herb, is an important economic crop in Asia. A recent isolate of camellia sinensis (GJS2-L) showed strong inhibition against two agriculturally important herbicides, glyphosate and imazamox, which are used for the control of weed in soybean (*Glycine max* (L.) Merr) crop. The metabolites of GJS2-L were investigated to determine the responsible herbicide sensitivity mechanism. Two active metabolites were isolated from GJS2-L by bioassay-guided isolation methods, and identified as fesalide (1) and deacetyl-fesalide (2), based on 1D/2D NMR spectroscopic data and HRESIMS analysis. Fesalide (1) exhibited strong herbicidal activity against broad spectrum weeds in soybean and broadleaf (*Brassicaceae*, *Chenopodiaceae*) crops, with 0.1 and 0.2 μM effective concentrations (EC50) for soybean and flowering vegetables, respectively. Additionally, 1 showed more than 95% inhibition of weed growth at submicromolar concentrations. The mode of action of 1 was determined as a novel and potent inhibitor of the key enzyme of chlorophyll biosynthesis, 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGR), via competitive inhibition. This study highlights the potential of camellia sinensis (GJS2-L) as a source of new herbicides that might be effective alternatives to traditional herbicides such as glyphosate and imazamox. At most recent estimates, the 2016 global suicide rate was 11.4 deaths per 100,000 people. Suicide was the leading cause of death for people aged 15 to 44 years. The risk of suicide in the past year was estimated to be as high as 14.4% of the population. Suicide was the 10th leading cause of death worldwide and was responsible for 1.4% of all deaths in 2016. Suicide was the second leading cause of years lost to disability worldwide. Suicide is a widespread problem that affects many countries and communities, and it is a major public health problem in the United States. This is a corrected version of

Q: What's the best approach to storing any kind of data, in the cloud or on a micro-service architecture? I have a number of things that I need to track and I've been thinking on the best way to store this data, and I have the option of either storing it locally or on a cloud. I've heard micro-services or the cloud may be a good approach, but I'm not clear on what type of architecture each would be best for. I don't want to store this data on a local server and I have only one web application. The data I need to store are: Customers Projects Tasks Analyst's comments Comments Tasks are also associated with customers, so that's the major tie in there. The data doesn't need to be searchable, but its requirement is fast retrieval. Its currently stored in a DB, but I plan to migrate this to any of the options I have available. I'm leaning towards the cloud, but am not sure. UPDATE: I will be able to handle the data in either of these ways: Offline (I do my best to maintain this regularly but can't eliminate all chances to lose it), Online (If I detect any changes, I will check for updates), or Implement a daemon on a remote host that will look for updates when it detects something changed.

A: Storing in the cloud is the best approach for what you are describing. Cloud storage servers are generally fast and reliable, and offer a suite of powerful, integrated services. Amazon Glacier is a good example of cloud storage that has already had real-world experience in many businesses. With a high-speed network and local computing power, you can take advantage of the power and security of the cloud, while still meeting your real-time requirements. I have previously recommended Amazon's RDS service for this sort of thing. RDS is a Reliable Database Service. Unlike previous instances of cloud storage (S3, AWS database instances, etc) a database will update itself in near real time. Database instances in the cloud are superdbs. Remember to purchase a service that supports your database. Here is a good article and its links to Amazon's products. Storing Locally No, you should not do this. For "Customers", you can use Redis. This is a high performance key-value store,
